

CHANGELOG

Author: **Mohamed Hamdan**

Date: **22/07/2026**

Case Study Name: **Google Capstone - Cyclistic**

(Guide: **Changes** are highlighted in blue, the **Results** are given in green and **Purpose** is given in red)

Following changes were made to the CSV data:

- Added a column **month_year** which gives the month and year of the row in the format MMM_YYYY (Eg: Jan_2025). This would give us the exact month the data was entered when the 2025 data is combined
- Added a column **row_id** which gives an ID to all the rows from Jan_2025 to Dec_2025. This is to help sort the data which will help in efficient data analysis
- Split the data above 100MB into two which will reduce the friction of importing the data from CSV to BigQuery

Following changes were made to the SQL database:

- Created a table **corrected_cyclistic_trips** to correct the format of started_at and ended_at time format. It was given in Minutes:Seconds.milliSeconds. Using logic, it was converted to Hours:Minutes:Seconds.milliSeconds. This was done to track the average trip duration by Casuals and Members
